#### **Solution**

The solution that we propose to solve the object localization problem consists of a CNN having 4 neurons in the output layer where each corresponds to the 4 output values i.e the bounding boxes coordedinates to be determined.

Therefore it will be solved as a regression problem.

### **Tools:**

Used keras, sklearn, numpy.

For training our model we used Google colab.

#### Final score:

The score we got was **0.79** approx.

# **Usage Instructions:**

Run train.py with appropriate data to train the model. Run test.py to generate output in form of .csv file.
